Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

FEBS Lett. 378:126-130(1996).

-!- FUNCTION: In addition to gelatin and collagens, it cleaves KiSS1 at a Gly-|-Leu bond.

-!- CATALYTIC ACTIVITY: Cleavage of gelatin type I and collagen types IV, V, VI, X. Cleaves the collagen-like sequence Pro-Gln-Gly-|-COPACTOR: Binds 4 calcium ions per subunit.

-!- COPACTOR: Binds 2 zinc ions per subunit.

-!- COPACTOR: Binds 2 zinc ions per subunit.

-!- COPACTOR: Binds 1 inhibited by histatin-5).

-!- SUBUNIT: Ligand for integrin alpha-V/beta-3.

-!- TISSUE SPECIFICITY: Produced by normal skin fibroblasts.

-!- TISSUE SPECIFICITY: Produced by NMP14 (MT-MMP1) and MMP16 (MT-MMP1).

72 kDa type IV collagenase.
Fibronectin type-II 1.
Fibronectin type-II 2.
Fibronectin type-II 3.
Hemopexin-like.
SIMILARITY: Belongs to the peptidase M10A family. SIMILARITY: Contains 3 fibronectin type-II domains. SIMILARITY: Contains 1 hemopexin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Collagenase-like 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Collagen-binding.

CHEM. ACTIVITY: Cleaves the collagen-like sequence Pro-Gln-Gly-]-
CHEM. COPACTOR: Binds 4 calcium ions per subunit (By similarity).
CHEM. COPACTOR: Binds 2 zinc ions per subunit (By similarity).
CHEM. The propeptide is processed by MMP14 (MT-MMP1) and MMP16 (MT-MMP1).
CHEM. The propeptide is processed by MMP14 (MT-MMP1) and MMP16 (MT-MMP1).
CHEM. The propeptide is processed by MMP14 (MT-MMP1) and MMP16 (MT-MMP17Y: Belongs to the peptidase M10A family.
CHEM. SIMILARITY: Bolangs to the peptidase M10A family.
CHEM. SIMILARITY: Contains 1 hemopexin-like domain.

Anti-angiogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular

N

```
The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) composities an effective amount of a peptide inhibitor of matrix metalloproteinase (MMP), where the peptide can inhibit the expression of VEGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting crowth of tumours and diminishing tumours size. The tumour can be metastatic, non-metastatic, vascularised, non-vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disperie retinopathy. The present sequence represents a human MMP cleavage rection peptide, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloproteinase (WMP) cleavage region peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase
of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. ABG76309-ABG76321 represent peptide inhibitors of MMPs

This peptide represents a matrix metalloprotease (MMP) inhibitor peptide by activated MMPs, e.g. for treating inappropriate angiogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarcoidosis. Antibodies to the peptides can be used to detect the MMPs and can distinguish activated from latent enzyme. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                   Matrix metalloprotease; inhibitor; tissue damage; angiogenesis; arthritis; tumour growth; granulomatous inflammatory condition; metastasis; sarcoidosis.
                                                                                                                                                                                      Matrix metalloprotease inhibitor peptide #23.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chondrosarcoma cells comprising an amount of a peptide and a pharmaceutical carrier. The invention may be useful for the production of pharmaceutical carrier. The invention may be useful for the production of compounds with a cytostatic activity acting as metalloprocease 1 inhibitors, metalloprocease 3 inhibitors, metalloprocease 4 inhibitors, metalloprocease 5 inhibitors, metalloprocease 6 inhibitors, metalloprocease 7 inhibitors, metalloprocease 9 inhibitors, metalloprocease 10 inhibitors, metalloprocease 11 inhibitors, metalloprocease 12 inhibitors, metalloprocease 12 inhibitors, metalloprocease 13 inhibitors or metalloprocease 12 inhibitors, cells which is the decreasing and inhibiting the growth of chondrosarcoma cells which in turn inhibits growth of a bone tumor or diminishes a size of a bone tumor, useful for treating chondrosarcoma cancers. The present sequence is that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        peptide derived from a human matrix metalloproteinase which may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   invention relates to a novel composition for inhibiting growth of

The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have epptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. The present sequence represents a partial sequence of human
                                                                                                                                                                                                                                                                                                                                               Novel peptide inhibitor of proteinase activity of matrix metalloproteinases, e.g. matrix metalloproteinase-2, useful for stimulating cellular proliferation of fibroblasts or keratinocytes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Match 100.0%; Score 114; DB 6; Length 43; Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproceinase (WMP), where the peptide an inhibit the expression of WEGF. (I) has eytostatic, vulnerary, cardiant, crebroprotective, antidiabetic, ophthalmological and dermaclogical activities. (I) can be used for inhibiting expression of WEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be metastatic, non-metastatic, vascularised, hard or soft. (I) is also useful for treating injuries including wounds, surgical incisions, chronic wounds, heart diseases and stroke. (I) is also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for treating disorders characterised by excessive angiogenesis e.g. macular degeneration and diabetic retinopathy. The present sequence represents a human MMP peptide, which is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; peptide inhibitor; matrix metalloproteinase-2; MMP-2; cleavage region; proenzyme form; cellular proliferation; fibroblast; keratinocyte; healthy skin development; wound healthy skin development; skin tone; wrinkle; anti-aging; vulnerary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Anti-angiogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Partial sequence from human matrix metalloproteinase-2 (MMP-2).
macular degeneration; diabetic retinopathy; cleavage region.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                               The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloproteinase (MMP) wound site peptide. This sequence is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel composition for inhibiting growth of chondrosarcoma cells comprising an amount of a peptide and a pharmaceutical carrier. The invention may be useful for the production compounds with a cytostatic activity acting as metalloprotease 1 inhibitors, metalloprotease 2 inhibitors, metalloprotease 3 inhibitors, metalloprotease 4 inhibitors, metalloprotease 5 inhibitors,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cell growth; pharmaceutical; cytostatic; metalloprotease 1 inhibitor; metalloprotease 2 inhibitor; metalloprotease 3 inhibitor; metalloprotease 4 inhibitor; metalloprotease 5 inhibitor; metalloprotease 6 inhibitor; metalloprotease 7 inhibitor; metalloprotease 8 inhibitor; metalloprotease 9 inhibitor; metalloprotease 10 inhibitor; metalloprotease 11 inhibitor; metalloprotease 12 inhibitor; metalloprotease 13 inhibitor;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an anti-angiogenic composition (I) for inhibiting expression of vascular endothelial growth factor (VEGF). (I) comprises an effective amount of a peptide inhibitor of matrix metalloproteinase (WMP), where the peptide inhibit the expression of VEGF. (I) has cytostatic, vulnerary, cardiant, cerebroprotective, antidiabetic, ophthalmological and dermatological activities. (I) can be used for inhibiting expression of VEGF, and so can be used for inhibiting growth of tumours and diminishing tumours size. The tumour can be metastatic, non-metastatic, vascularised, non-vascularised, hard or soft.
metalloprotease 6 inhibitors, metalloprotease 7 inhibitors, metalloprotease 9 inhibitors, metalloprotease 9 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors or metalloprotease inhibitors. The composition is useful for decreasing and inhibiting the growth of chondrosarcoma cells which in turn inhibits growth of a bone tumor or diminishes a size of a bone tumor, useful for treating chondrosarcomas and bone cancers. The present sequence is that is a peptide derived from a human matrix metalloproteinase which may be used during the development of a composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human matrix metalloproteinase 2 cleavage region peptide SEQ ID NO:2.
                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Anti-angiogenic composition comprising peptide inhibitor of matrix metalloproteinase, useful for decreasing the expression of vascular endothelial growth factor and treating cancers and tissue injuries.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to peptide inhibitors of metalloproteinases (MMPs), particularly metalloproteinase-2 (MMP-2). The inhibitors have peptide sequences related to the cleavage regions of the proenzyme forms of the MMPS. The peptide inhibitors are useful for stimulating cellular proliferation of fibroblasts or keratinocytes, promoting healthy skin development, treating wounds, preventing scarring, improving skin tone, reducing wrinkling and for simulating the development of smooth, healthy skin. The peptide inhibitors are useful as anti-aging and wound healing compounds. ABG76309-ABG76321 represent peptide inhibitors of MMPs
           incisions, chronic wounds, heart diseases and stroke. (I) is also useful for treating disorders characterised by excessive angiogenesis e.g. macular degeneration and diabetic retinopathy. The present sequence represents a human MMP cleavage region peptide, which is used in the exemplification of the present invention
                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                           Human; peptide inhibitor; matrix metalloproteinase-2; MMP-2; cleavage region; procazyme form; cellular proliferation; fibroblast; keratinocyte; healthy skin development; wound healing; scarring; skin tone; wrinkle; anti-aging; vulnerary.

The present invention provides peptides and compositions containing such peptides that are useful as agents to maintain healthy skin and to promote the condition of the skin. The invention is useful for increasing the amount of fibronectin in tissue. The invention is also useful for encouraging the maintenance and development of healthy skin, preventing and treating wrinkles and for treating wounds. The invention acts as vulnerary and dermatological agents. The present sequence is human matrix metalloproteinase (MMP) cleavage region peptide. This sequence is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Composition used for preventing and treating wrinkles and treating wounds comprises peptide having sequence related to matrix metalloproteinase

Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Protein #4665 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, gene expression, heart, microarray, vascular system,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention relates to a novel composition for inhibiting growth of chondrosarcoma cells comprising an amount of a peptide and a pharmaceutical carrier. The invention may be useful for the production of compounds with a cytostatic ectivity acting as metalloprotease 1 inhibitors, metalloprotease 2 inhibitors, metalloprotease 3 inhibitors, metalloprotease 6 inhibitors, metalloprotease 5 inhibitors, metalloprotease 6 inhibitors, metalloprotease 9 inhibitors, metalloprotease 10 inhibitors, metalloprotease 11 inhibitors, metalloprotease 11 inhibitors or metalloprotease 12 inhibitors, metalloprotease 13 inhibitors or metalloprotease 12 inhibitors or the composition is useful for decreasing and inhibiting the growth of chondrosarcoma cells which in turn inhibits growth of a bone tumor or diminishes a size of a bone tumor, useful for the treating chondrosarcoma cancers. The present sequence is that the treating chondrosarcoma cancers. The present sequence is that the treating chondrosarcoma cancers. The present sequence is that the treating chondrosarcoma cancers. The present sequence is that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A composition for decreasing and inhibiting the growth of chondrosarcoma cells, useful for treating chondrosarcomas and bone cancer, comprises a matrix metalloproteinase inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of a peptide derived from a human matrix metalloproteinase which may be used during the development of a composition of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide #4866 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21515-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The invention relates for a spatially-addressable set of single expunctor, concluded are adjusted expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12819 open reading frames derived from the 12614 probes which hybridises at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung; comprising (a) contexting the array with a collection of detectably labeled nucleic acids derived from human lung; comprising (a) contexting the array with a collection of detectably labeled nucleic acids derived from human lung or array; identifying exons in a elekaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of algorithmically predicting at least one exon from genomic sequences of the extraction of array identifying exons in a elekaryote lung mRNA, to a single exon probe, above and (b) measuring the expression of each of the exons in several comprising (a) identifying exons from genomic sequence by the method comprising of in the above mentioned microarray; assigning exons to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons should be assigned to a single gene; a peptide comprising on the town of the exons should be assigned to a single gene; a peptide comprising on the reading frames (ORF). The probes are used for gene expression analysis, and for identifying exons in a gene, particularly using human compression the exons should be assigned to a single gene; particularly using human compression of the exons should be assigned to a single sease (ORDP), interstitial lung cancer, chronic obstructive pulmonary disease (ORDP), interstitial lung cancer, chronic obstructive pulmonary disease (ORDP), interstitial lung cancer, chronic obstructive pulmonary dis ö Spatially-addressable set of single exon nucleic acid probes, used to measure gene expression in human lung samples. The invention describes a new isolated polymucleotide (I) encoding a polypeptide with biological activity comprising: a nucleotide sequence of the NoS: 1-567 (tully defined); a nucleotide sequence of to the sequence of (I) under stringent hybridization conditions; or a nucleotide sequence of (I) under stringent hybridization conditions; or a nucleotide sequence of (I) absorbed are: a(n) (expression) vector comprising (I); a host cell genetically engineered to comprise (I) operatively, associated with a regulatory sequence that modulates expression of the polymucleotide in the host cell; an isolated polypeptide comprising a sequence of SEQ ID NOS: 568-1134 (fully defined), where the polypeptide (IS: a polypeptide encoded by (I); or a polypeptide encoded by a sequence of SEQ ID NOS: 568-1134 (fully defined), where the polypeptide of carrier; an antibody directed against the polypeptide of (3); a method (or detecting the polypeptide of (3); a method (or identifying a compound that binds to the collection of polymucleotides, where the collection comprising any of the sequences of SEQ ID NOS: 1-567. (I) is a polymucleotide with biological cutvity, which comprises any of the amino acid sequence of SEQ ID NOS: 1-567. (I) is a polymucleotide with biological cutvity, which comprises any of the amino acid sequence of SEQ ID NOS: 1-567. (I) is a polymucleotide comprising any of the sequences and methods are useful in diagnostics, forensic, and gene cutvity, which comprises any of the amino acid sequences or dispenses or the relation of dispense or dispense or composition and method are useful for treating a disease or dispense. Service or succeoprosis, observativity, not service or succeopriment of paymons seponences. Service or succeoprises and produces dependent on DNA and amino acid sequences. Service or succeoprise and produces sequences and encoded by the sequence or sequences or detection or seponence or sequences or descentivity, and for treating a disease, burns, or succeoproces, or succeoprative or sequences or d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                autoimmune disorders, viral infection, or cancer. This is the amino acid sequence of a novel polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 194 AA;

```
The present sequence represents a polypeptide (II) with biological activity, which is encoded by an isolated polynucleotide sequence (I) from the present invention. Also described: (I) a vector comprising (I); (2) an expression vector comprising (I); (3) a host cell genetically engineered to comprise (I) which is operatively associated with a cerulatory sequence that modulates expression of (I) in the host cell; (4) a polypeptide (II) encoded by (I); (5) a composition comprising the polypeptide of (4); and a carrier; (6) an antibody directed against the colypeptide of (4); (7) detecting (I) or the polypeptide of (4); in a sample; (8) identifying a compound that binds to the polypeptide of (4); (6) producing the polypeptide of (4); and (10) a collection of polymucleotides comprising at least one of the polymucleotide sequences (I). The polymucleotides (I) can be used as hybridisation probes, coligomers or primers, for chromosome or gene mapping, for the recombinant production of proteins, and for generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 114; DB 7; Length 445; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to human nucleic acid molecules that are specific to lung cells, lung tissue and/or the lung organ. These lung specific nucleic acids may be naturally occurring cDNA, genomic DNA, RNA or a fragment, or a non-naturally occurring nucleic acid. Due to alternative splicing and transcriptional modification one lung-specific correct alternative splicing and transcriptional modification one lung-specific correct or alternative splicing and transcriptional modification one lung-specific correct in a part of the modification one lung-specific correct in a patient. List) sequences, Described is a method of determining the presence of a lung specific nucleic acid correct or protein in a sample; and a cancer in a patient. Claimed is a vaccine comprising the polypeptide or the nucleic acid encoding the polypeptide or cancer in a patient. Claimed is a vaccine comprising the presence of a lung specific nucleic acid in a sample comprises contacting the sample correct in a patient. Claimed is a vaccine comprising the presence of a lung specific nucleic acid in a sample comprises contacting the sample correct in a patient. Claimed is useful for treating a patient with lung specific nucleic acid nolecule above which will hybridize to a lung specific acid molecule as useful for treating a patient with lung cancer cell expressing the nucleic acid molecule and polypeptide are also useful for identifying, claimide is useful molecule or polypeptide. The nucleic acid molecule and polypeptide are also useful for identifying and/or designing (ant) agonists of the polypeptide, and for identifying and/or designing (ant) agonists of the polypeptide, and for identifying and/or designing (at a human lung specific protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     acid molecule from Homo sapiens, useful for identifying, monitoring, staging, imaging and treating a patient with lung

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain caction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed corpus of (II) as useful in gene therapy techniques to restore normal cactivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cupylement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abscrant protein espensions in diagnostics, forensics, gene mapping, identification of mutations diagnostics, forensics, gene mapping, identification of mutations of esponsable for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Absconolo-Abg30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WHDO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

```
The original source of the protein material was H-ras transformed human bronchial epithelial cells (TBB-1). The AA sequence was then used to develop oligonucleotide probes which were used to oscreen a cDNA library of human skin fibroblast mRNA. The longest clone, pGEL 186.2, represented almost the full gelatinase mRNA sequence except the leader sequence encoding the first few AA's of the signal peptide. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding human type IV collagenase (gelatinase) - for use in the treatment of hypertrophic scars, keloids and intervertebral disc disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human type IV collagenase; gelatinase; hypertrophic scars; keloids; intervertebral disc disease; extracellular matrix metalloprotease; bronchial epithelial cells; TBB-1 cells; pGell86.2; type II motif; fibonectin; collagen-binding domain.
                 Sequence of human type IV collagenase (gelatinase) in pGEL 186.2.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel diagnostic and therapeutic polymucleotides selected from one of the 2722 sequences defined in the specification. A propertie of the invention may have a use in gene therapy. The human diagnostic and therapeutic polymucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine cautoimmune/inflammatory disorder, developmental disorders, endocrine disorder, neurological disorder, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp conflections caused by virus, bacteria, fungi or parasite. The dithp conflorment of molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single mucleotide polymorphisms, as molecular weight markers, and for somatic or germline cannot hological samples in detecting single mucleotide control of the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

                                                                                                                                                                                                                                                     DNA encoding human type IV collagenase (gelatinase) - for use in the treatment of hypertrophic scars, keloids and intervertebral disc disease.
                                                                                                                                                                                                                                                                                                                                        Human type IV collagenase (gelatinase). Protein source was H-ras determined human bronchial epithelial cells (TBE-1). The sequence was determined from clone pdel 186.2 which represents almost the full mRNA sequence. Peature 1 is the N-terminal domain, I; feature 2 is a middle domain, II, which is organised into 3 x 58 amino acid long head to tail repeats (features 4,5, and 6). These show homology to the type II motif collagen binding domain of fibronectin. Feature 3 is the C-terminal domain. The enzyme could be used in the treatment of hypertrophic scars, Keloids, and intervertebral disc disease. See also AAN91700. (Updated on 25-MAR-2003 to correct PR field.) Type IV procollagenase was purified from human A2058 melanoma cells. The complete amino acid sequence was determined (see also Hoyhtya, M. et al, (1988) FBES Letters 233, 109-113). Based on this sequence, peptides were synthesised (see features) having homology with a histidine contg domain at residues 371-386, a cysteine contg. domain at residues 200-370, the 80 cereidue amino terminus or a region 159 residues from the carboxy terminus. These regions correspond to the enzyme with the substrate. The peptides are useful in metalloproteinase detection and inhibition. They can be used in the treatment of inappropriate angiogenesis, arthritis, tumour growth, invasion and metastasis and granulomatous inflammatory conditions such as sarciodisis. The peptides can be used to produce antibodies. Peptide 6, at concn. of 0.1 mM inhibited 80% of the caryme activity. See also US/494794, and W09010228. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a human type IV matrix metalloprotease (MMP) zymogen (precursor protein). The invention relates to MMP inhibitor peptides which can be used to treat tissue damage caused by activated MMPB, e.g. for treating inappropriate anglogenesis, arthritis, tumour growth, invasion and metastashs and granulomatous inflammatory conditions such as sarcoidosis. Antibodies to the peptides can be used to detect the MMMP and can distinguish activated from latent enzyme. (Updated on 25-MAR-2003 to correct PR field.) (Updated on 25-MAR-2003 to correct PA field.) The present sequence represents the mature protein of human matrix metalloprotease-2 (MMP-2). Fragments of this protein (AAM41228-33) are able to act as alpha-v-beta-5 can inhibit to vitronectin receptor. Inhibitors of alpha-v-beta-5 can inhibit an inhibitor. Inhibitors of angiogenesis. The specification describes a novel labelled package that contains an inhibitor of angiogenesis i.e. an alpha-v-beta-5 antagonising polypeptide that binds to integrin alpha-v-beta-5 antagonising polypeptide that binds to integrin alpha-v-beta-5 and includes a part of the C-terminal domain of MMP. The antagonists are used to inhibit to angiogenesis in inflamed tissue, in solid tumours or metascases, and in a wide range of ocular disorders (e.g. diabetic or other forms of retinopathy, neovascular glaucoma, or corneal transplants). They are retinopathy, neovascular glaucoma, or corneal transplants). They are retinopathy, neovascular glaucoma, or corneal transplants.

The alpha-v-beta-5 antagonists can also be used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to inhibit neovascularisation where this is induced by cytokines, e.g. inhibit neovascularisation where this is induced by cytokines, e.g. transforming growth factor alpha, epidermal growth factor or especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Packaging material containing polypeptide antagonist of alphav, beta5 integrin - used for inhibition of angiogenesis, and for treating tumours, inflammation, eye diseases etc.
Matrix metalloprotease-2; MMP-2; alpha-v-beta-5 antagonist; treatment; vitronectin receptor; inhibition; angiogenesis; integrin; tumour growth; restenosis; neovascularisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                      The present invention relates to novel synthetic oligopeptides effective in blocking cancer invasion and metastasis. The invention relates to matrix metalloproteinase 2 (MMP-2) peptides. The synthetic oligopeptides are useful as pharmaceutical compositions for blocking or treating cancer useful as pharmaceutical compositions for blocking or treating cancer useful and metastases in a human patient. In particular, they are useful for treating brain cancer, lung cancer is kin cancer or breast cancer. The oligopeptides are also useful as vaccines for preventing these cancers, enhancing immune response or raising antibodies for assays used to diagnose diseases involving matrix metalloproteinases or clinical monitoring of the progression or regression of disease. They are also useful in gene therapy. The present sequence is the human MMP-2 protein.
                                                                                                                                                                        New synthetic oligopeptide, useful for blocking or treating cancer invasion and metastases in a human patient, particularly as a vaccine for treating or preventing diagnosing brain cancer, lung cancer, skin cancer or breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              vitronectin receptor antagonist; neovascularisation; cancer; tumour; inflammation; rheumatord arthritis; retina; diabetic retinopathy; restenosis; smooth muscle cell migration; angioplasty; antiangiogenic; cytostatic; antiinflammatory; antiarthritic; antirheumatic;

The invention relates to a method of inhibiting angiogenesis in a tissue by the administration of a composition comprising an organic by the administration of a composition comprising an organic peptidomimetic antagonist of integrin alpha-V beta-3 diterior. Vitronectin receptor) The integrin alpha-V beta-3 antagonist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumour metastrases; to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation is occurring (e.g., in rheumatoid arthritis); to treat neovascularisation in retinal tissue by inhibiting smooth muscle retinopathy; to treat restenosis in a tissue by inhibiting smooth muscle cell migration (such as that which occurs following angioplasty); and to reduce the blood supply to a tissue required to support new growth of the tissue. The present sequence represents human mature matrix metalloprotease 2 (MMP-2, gelatinase) used in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Administration of composition comprising organic peptidomimetic alpha-v beta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Angiogenesis inhibitor; integrin alpha-V beta-3 antagonist; vitronectin receptor antagonist; neovascularisation; cancer; tumour; inflammation; rheumatiod arthritis; retina; diabetic retinopathy; restenosis; smooth muscle cell migration; angioplasty; antiangiogenic; cytostatic; antiinflammatory; antiarthritic; antirheumatic; ophthalmological; antidiabetic; vasotropic; muscular-gen.;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of inhibiting angiogenesis in a tissue by the administration of a composition comprising an organic by the administration of a composition comprising an organic peptidomiment alpha-V beta-3 attaconnectin receptor). The integrin alpha-V beta-3 attaconist and compositions containing it are useful for inhibiting angiogenesis in a variety of medical conditions. The antagonist may be used to induce the regression of solid tumours or solid tumour metastases; to inhibit the growth of solid tumours undergoing neovascularisation; to treat inflamed tissue in which neovascularisation in retinal tissue (e.g., in rhemmatoid arthritis); to treat neovascularisation in retinal tissue (e.g., in diabetic retinopathy); to treat restenosis in a tissue by inhibiting smooth muscle retinopathy; to creat restenosis in a tissue by inhibiting smooth muscle celuce the blood supply to a tissue required to support new growth of the tissue. The present sequence represents mouse matrix matrix in the present sequence represents mouse mature matrix in the present sequence represents mouse mature matrix.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                     Administration of composition comprising organic peptidomimetic alpha-v beta-3 antagonist to e.g. inhibit angiogenesis (inflamed tissue angiogenesis, retinal angiogenesis and tumor angiogenesis) in a tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present sequence is that of human matrix metalloproteinase-2 (WMP-2), previously known as 72 kDa galatinase and gelatinase A. MMP-2 is capable of degrading the extracellular matrix components of the basement membrane. The invention relates to methods for treating pain in a patient by administration of an inhibitor of MMP-2 and MMP-9 (see AAB20491). The administration of an inhibitor of MMP-2 is useful for treating nerve tissue damage (claimed), where the patient is suffering from a disease or ischaemia and creebral infarction (claimed). The method is useful for treating a disease, disorder or nerve tissue damage selected from thanced or exaggerated sensitivity to acute pain, burn pain, atypical facial pain, pack pain, complex regional pain syndrome clain pain, post-herpetic neuralgia, phantom limb pain, labour pain, concernion, post-herpetic neuralgia, phantom limb pain, labour pain, concernion, past-herpetic neuralgia, phantom limb pain, pain, post-erroke pain, post-cherpetic neuralgia, paintom limb pain, pain, post-erroke pain, post-cherpetic neuralgia, paintom limb pain, physiological pain, inflammatory pain, acute inflammatory conditions/visceral pain, neuralgia, painful diabetic retinopathy, cramatic nerve injury, and tolerance to narcotics or withdrawal from narcotics (claimed). MMP-2 polypeptides can also be used to screen for agonist or antagonist (inhibitor) compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Polypeptide for the treatment of pain and the reduction of tissue damage comprises an inhibitor of human matrix metalloproteinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gape

The specification describes a pharmaceutical composition, comprising a growth factor, an inhibitor agent, i.e. a protease. The inhibitor agent inhibits the action of at least one specific adverse protein, i.e. a protease, that is upregulated in a damaged tissue such as a wound environment. Growth factors which are included in the composition of the invention are platelet-derived growth factor (PDGP), fibroblast growth factor (FGP), connective tissue derived growth factor (CTGP), connectived growth factor (KGF), transforming growth factor (VGF), cypeneral growth factor (KGF), vascular endothablal growth factor (VGF), and chrysalin. Inhibitors which are included in the composition of the invention include inhibitors of urokinase-type plasminogen activator (UPA) and matrix metalloproteinase (MMP). The composition is useful for the treatment of chronic damaged tissue, i.e. wounds and dermal ulcers. The present sequence represents a human MMP-2, and is used to produce the composition of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, matrix metalloproteinase; MMP-2; hair growth; antisense therapy; endopeptidase; skin cell; breast cancer; hair follicle; chromosome 11q22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated matrix metalloproteinase-25 nucleic acid molecule and proteins encoded by them whose inhibition is useful for modulation of hair growth in mammals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                       The present sequence is human matrix metalloproteinase (MMP)-2 protein used in the exemplification of the invention. MMP-25 DNA is located on chromosome liq22. Matrix metalloproteinases are a family of zinc dependent endopeptidases that function extracellularly to degrade proteins typically found in the extracellular matrix. MMP-25 is expressed in skin cells of mammals, particularly in breast cells and hair follicles. WMP-25 DNA is useful for identifying a nucleic acid molecule encoding all or part of MMP by hybridising MMP-25 to a nucleic acid sample and identifying a sequence that hybridises in the nucleic acid sample. The identification step involves performing polymerase chain reaction (PCR) to amplify the hybridising sequence. WMP-25 antibody is useful for identifying type 25 MMP. MMP-25 protein inhibitors may be used to modulate hair growth and breast cancer in a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; matrix metalloproteinase-2; MMP-2; enzyme; thrombolytic; antiocagulant; cardiant; antiarteriosclerotic; cytostatic; osteopathic; antinflammatory; antibacterial; virucide; fungicide; antipsoriatic; vulnerary; cerebroprotective; antianginal; ophthalmological; antirheumatic; antiarthritic; antiulcer; vasotropic; nephrotropic; alpha-vbeta-3 integrin receptor; thrombosis; tumour; osteoporosis; infection; veterinary medicine; rheumatoid arthritis; Crohn's disease; antimicrobial; antiseptic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             489. .497

The invention relates to peptides (ABB79414-ABB79426) derived from the C-
terminal fragment PEX of matrix metalloprotease-2 (MMP-2). Matrix MMP-2
derivatives of formula X-Y-Z (1) and their salts and solvates are
C described. X = H, 1-10C alkanoyl or peptide fragment consisting of 1-20
described. X = H, 1-10C alkanoyl or peptide fragment consisting of 1-20
c naturally occurring amino acid residues; Y = peptide fragment selected
from the sequence region 466-660 of human Pro-WMP-2; and Z = OH, NH 2, NH
C-1-10C alkyl N(1-10C alkyl) 2 or peptide fragment consisting of 1-20
naturally occurring amino acid residues. Primary amino groups are
c optionally protected conventionally. The peptides and MMP-2 derivatives
are used for combating diseases involving interaction of ligands
c sepecially pathological processes supported or propagated by
ampiogenesis, thrombosis, cardiac infarction, coronary heart disease,
c sepecially pathological processes supported or propagated by
ampiogenesis, thrombosis, cardiac infarction, coronary heart disease,
c infections, psoriaeis or wound healing deficiency. More generally the
peptides and MMP-2 derivatives are useful in human and veterinary
c medicine for the treatment and/or prophylaxis of thrombosis, myocardial
c infarction, applexy, angina pectoris, tumour diseases, osteolytric
diseases (e.g. inflammation), ophthalmological diseases (e.g. inflammation), ophthalmological diseases (e.g. inflammation), rheumatoid arthritis, osteoarthritis
c rubbootic glaucoma), rheumatoid arthritis, osteoarthritis
c colitis, Crohn's disease, atherosclerosis, psoriasis, restenosis after
c majophasty, macular degeneration, myopta, ocular histoplasmosis or
c rubbootic glaucoma), rheumatoid arthritis, osteoarthritis
c operations involving biomaterials, implants, catheters or cardiac
c perentions involving biomaterials, implants, catheters or cardiac
c pacemakers); or as diagenses or reagents or reagents. The present sequence is

The present invention relates to a method for diagnosing breast cancer in a subject suspected of having endometrial cancer. The method comprises determining the expression of a set of human genes or expression products in an endometrial sample suspected of being cancerous. The human genes of the invention are differentially expressed in breast tumours endometrially expressed in breast tumours of some of contraining the cativity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment of endometrial cancer. AND#361 represent the human proteins of the invention that are differentially expressed in breast cancer tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New purified human transmembrane protein, designated as tumor endothelial marker (TEM) 3, useful for detecting, diagnosing or treating tumors, polycystic kidney disease, diabetic retinopathy, rheumatoid arthritis or psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a novel method for the isolation of endothelial cells (ECs), and the identification of genes expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Tumour endothelial marker; normal endothelial marker; PEM; pan-endothelial marker; polycystic kidney disease; psoriasis; diabetic retinopathy; rheumatoid arthritis; tumour anglogenesis; neoangiogenesis; immune response; cytostatic; antidiabetic; ophthalmological; antirheumatic; antiarthritic; antipsoriatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; endothelial cell; EC; tumour endothelial cell; TEM; NEM;
